In AP psychology, parallel processing is a replication of a counseling session when under supervision. The therapist will be the client, and the supervisor is the therapist. This can help a therapist who feels like they aren't going anywhere with the client. Both sides are becoming frustrated due to the lack of progress.

Parallel processing is a method in computing of running two or more processors (CPUs) to handle separate parts of an overall task. Breaking up different parts of a task among multiple processors will help reduce the amount of time to run a program. What is Parallel Processing? THROUGHPUT AND LATENCY • We can use parallelism to increase throughput by using a larger number of lower clocked processing units (as in the GPU) which is well suited for computation intensive applications (applications with need of large number of calculations such as image processing applications).
