Difference Eigenvalue Based Gaussian Noise a difference eigenvalue based noise variance estimation method is presented. This method first calculates the difference eigenvalue edge indicator values of every pixel in an image. Difference Eigenvalue Based Gaussian Noise Variance ... The difference eigenvalue [10] is based on the Hessian matrix of the image. We use a Gaussian filtered version of the Hessian matrix to improve the robustness to noise: ... Effective image noise removal based on difference eigenvalue Based on the eigenvalues of the Hessian matrix, the difference eigenvalue manifest itself in terms of structural information of an image. The analysis is focused on two eigenvalue-based methods, namely Roy's largest root test, which requires knowledge of the noise variance, and the generalized likelihood ratio test, which can be interpreted as a test of the largest eigenvalue vs. a maximum-likelihood estimate of the noise variance.
