approximately 50% of this 4-day training course, with carefully designed hands-on exercises to reinforce learning. Practical Embedded Linux Device Drivers Online - Doulos Linux has a monolithic kernel. For this reason, writing a device driver for Linux requires performing a combined compilation with the kernel. Another way around is to implement your driver as a kernel module, in which case you won't need to recompile the kernel to add another driver. We'll be concerned with this second option: kernel modules. Linux Device Drivers: Tutorial for Linux Driver Development This is the Series on Linux Device Driver. The aim of this series is to provide, easy and practical examples so that everybody can understand the

Drivers is designed to give engineers the knowledge and skills to work confidently with all the components of the kernel to successfully develop device drivers. Workshops comprise approximately 50% of this 4-day training course, with carefully designed hands-on exercises to reinforce learning. Practical Embedded Linux Device Drivers - Doulos As devices are bound to drivers, they are added to the device class that the driver belongs to. Before the driver model core, this would typically happen during the driver's probe () callback, once the device has been initialized. It now happens after the probe () callback finishes from the core. The device is enumerated in the class. Device Classes — The Linux Kernel documentation Device
